EDUCATION

Stevens Institute of Technology | B.S. Computer Science

Graduation: December 2027

Relevant Coursework: Data Structures, Algorithms, Computer Architecture, Discrete Structures, Database Management Systems, Systems Programming, Software Development Process, Multivariable Calculus, Linear Algebra, Statistics and Probability, Web Programming

Honors and Activities: Edwin A. Stevens Scholar, Dean's List, South Asian Student Association (President), Delta Sigma Pi (VP of Alumni Relations, Community Service), Stevens Computer Science Club, Consulting Group, Stevens Blueprint, Student Government Association

EXPERIENCE

Liquicity | Frontend Engineer

May 2025 – August 2026

- Designed and implemented frontend responsive architecture for both web and mobile platforms using React.js and React Native, mapping key user flows for SMB payout admins and freelancers, accelerating onboarding by 30% and ensuring alignment with brand UX standards
- Developed and shipped secure, scalable client-side applications with Auth0 authentication, integrated REST APIs for payout and FX data, and boosted performance by abstracting reusable components, instituting feature branch workflows, and managing iOS test stabilization

SteamWorks Studios | Robotics Instructor | Python

August 2023 – June 2024

- Led and mentored 20+ students (ages 7-12) in VEX Robotics and FIRST LEGO League (FLL), designing and delivering a structured robotics curriculum covering mechanical design, sensor integration, and Python based autonomous control systems; coached 6 competitive teams in building fully autonomous robots using modular architecture, event driven logic and debugging, with teams placing 2nd-13th regionally
- Directed the Robotics Coaching Program, teaching students to engineer and program LEGO SPIKE robots using path-planning strategies and PID-based motor control concepts; guided teams through technical documentation and competition presentations while serving as Lead instructor for summer courses in Java, Python and applied robotics, resulting in improved robot stability and successful competition results

OM Cultural Group | Director and Event Manager

September 2020 – June 2024

- Directed and executed 30+ professional development and cultural events, managing budgeting, logistics, vendor coordination, marketing, sponsorship outreach, and cross functional teams to increase youth engagement and strengthen community participation and partnerships
- Organized 5 large scale cultural programs with 5,500 attendees, generating \$10,000+ in net profit to fund cultural scholarships while overseeing financial tracking, revenue analysis, and operational efficiency to ensure sustainable program growth and future success within the community

PROJECTS

Sports Outcome Prediction Model

February 2026 – August 2026

- Developing supervised machine learning models to predict NFL game outcomes using 10+ seasons of historical team and game level data, performing feature engineering on rolling statistics, ELO ratings, weather variables and different player and team-based efficiency metrics
- Implementing data preprocessing pipelines using Pandas and Scikit-learn, training and comparing Logistic Regression, Random Forest and XGBoost models using season-based train/test splits cross validation for model evaluation
- Building and deploying an end-to-end ML pipeline with FastAPI and AWS, automating data ingestion, feature updates, and model retraining workflows while exposing scalable RESTful prediction endpoints for integration with a frontend analytics dashboard and real time analysis

Fantasy Football Analyzer

May 2025 - January 2026

- Architected and deployed a full stack fantasy football analytics platform using React, Swift, Node.js and AWS cloud infrastructure, delivering real time weather intelligence, predictive player performance modeling, recommendation systems and ADP analytics through scalable REST APIs, modular backend services, and optimized frontend rendering pipelines, supporting 50+ users, predicting at an 89% accuracy level
- Developed and produced custom weather impact scoring algorithms in Node.js that modeled wind speed, precipitation, and temperature across different player positions, by normalizing historical game data and running rolling backtests across multiple past NFL seasons, also integrated this algorithm directly into the recommendation pipeline to adjust weekly projections and lineup rankings based on real-time forecast updates
- Built and automated a scalable data pipeline using Axios, node-cron, and AWS services to scrape and normalize data from ESPN, NFL, FantasyPros and FOX, which helped process over 1K+ data points weekly, which helped enable hourly weather refreshers and weekly ADP synchronizations for accurate up to date data on game time injuries or potential starting position changes

GPA Calculator Website

July 2024 - November 2024

- Engineered and deployed a responsive GPA calculator web application using HTML and CSS, architecting a structured, maintainable front end layout that enabled students to input coursework, assignments and grades to compute cumulative and weighted GPA values with accuracy
- Designed and implemented scalable grade weighting logic to support Honors, AP, and standard course calculations, incorporating edge case handling and structured input validation to ensure accurate GPA computation and consistent real time performance feedback
- Increased student accessibility to academic performance tracking by acquiring over 45 active users within two months, with instant results allowing for adding, editing and removing courses, and credit values through a responsive and structured layout

SKILLS AND INTERESTS

Languages and Skills: Python, Java, Scheme, HTML, CSS, SQL, Pandas, NumPy, Matplotlib, IntelliJ, VS Code, Project Management, Agile

Interests: Soccer, Football, Fantasy Football and Soccer, Hiking, Traveling, Photography, Music, History, Board Games
